EQUIPMENT AND TOOL TRACKING

Short overview of the system and approach

evidenca.eu is a web-based system for clear and reliable tracking of tools, equipment, and movable assets in companies where work takes place in the field, across multiple locations, or between different teams.

The goal of the system is not to introduce additional bureaucracy, but to establish a clear overview of what the company owns, where the equipment is located, and who is responsible for it — without complicated procedures.

When does it make sense to consider an equipment tracking system?

When working with installation or field teams, situations like the following occasionally occur:

- certain tools or materials are not at the right site,
- there is no clear overview of which team has which equipment,
- searching for equipment causes delays or additional trips,
- records are kept in Excel, by memory, or via phone calls,
- responsibility for equipment is not clearly defined.

If at least one of these situations sounds familiar, these are exactly the types of issues that evidenca.eu is designed to address.

What evidenca.eu is not

The system is not intended to:

- eliminate improvisation, which is often necessary in practice,
- complicate field work with additional administration,
- require extra applications or complex procedures for employees.

Improvisation remains part of everyday field work. evidenca.eu helps where improvisation starts to consume time, create misunderstandings, or generate unnecessary costs.

EQUIPMENT AND TOOL TRACKING

How the system works in practice

The system is designed to be simple to use:

- Each tool or piece of equipment receives a QR label.
- Equipment is checked in or out by scanning the QR code, which opens directly in a web browser — no app installation required. The QR code can be scanned by a field worker or centrally by a responsible person (e.g. in a warehouse), depending on the company's existing workflow.
- Equipment is assigned to a user, team, vehicle, or location.
- Every movement is recorded automatically.
- Management has a real-time overview of:
    - where each item is located,
    - who is using it,
    - the movement history and current equipment status.

For employees or responsible staff, this takes only a few seconds; for the company, it provides a central and up-to-date overview of equipment — without additional administration. evidenca.eu adapts to the company's way of working and does not require changes to existing processes.

Who the system is suitable for

The greatest value is delivered to companies that:

- have multiple teams, projects, locations, or vehicles,
- work with equipment that moves between sites or departments,
- want clearer responsibility and better visibility over equipment usage.

The system is also very well suited for:

- smaller teams (even with just a few employees),
- a single location divided into multiple departments,
- creating order where things currently "mostly work," but without a clear structure.

Typical use cases

- construction and installation companies,
- electrical, plumbing, and HVAC teams,
- service and technical companies,
- companies with their own equipment that circulates between projects or departments.

Pricing and usage

The system is licensed per company, not per individual user.

A typical company pays approximately
EUR 100 / month + VAT for the system.

The final price depends on company size and scope of use and is determined after a short introductory discussion.

The price includes:

- a dedicated system instance,
- hosting and basic maintenance,
- support during initial setup and data import.

Expandable System

evidenca.eu is currently focused on tracking individual tools and equipment items.
The system architecture allows it to be extended to other asset types, such as consumables, containers or more detailed location structures — without switching platforms.

Next step

If you would like to see whether this approach makes sense for your company, the next step is a short, non-binding conversation (15–20 minutes).

During the call:

- you briefly describe how equipment tracking currently works in your organization,
- we demonstrate a typical system workflow,
- together we assess whether evidenca.eu could bring added value in your specific case.

The conversation does not imply any obligation or decision to use the system. Its purpose is simply to explore how this approach could support your existing way of working.
